CHO SYSTEMS BIOLOGY CENTER

2:30 PM

A SYSTEMS APPROACH TO ENGINEERING MAMMALIAN CELLS FOR BETTER THERAPEUTICS

Nathan Lewis, Professor, Department of Pediatrics,
UC San Diego School of Medicine

Over the past three decades, mammalian cells have emerged as key hosts for the production of therapeutic proteins. Indeed, of the top ten pharmaceuticals by global sales in 2014, six are produced in mammalian cells, such as Chinese hamster ovary (CHO) cells. Furthermore, in just the last few years, over half a trillion dollars worth of product has been produced in CHO cells. However, despite the success of several protein-based drugs, there is a growing awareness of the importance of controlling critical quality attributes (CQAs) that impact drug safety and efficacy, and that rational cell line engineering is often needed to control product quality. The hurdles limiting mammalian cell engineering are just now being overcome with the emergence of novel tools, resources, and analysis methods. In the CHO Systems Biology Center in the Jacobs School of Engineering, we are developing genomic and systems biology resources and big-data analytics to guide the rational engineering mammalian cells. In this talk, I will highlight computational approaches for managing big data for cell engineering and guiding the development of better drugs and biosimilars.

ABOUT: CHO SYSTEMS BIOLOGY CENTER

As world leaders in both systems biology and CHO research, the Center for CHO Systems Biology is uniquely positioned – and driven – to develop new resources and techniques that empower the biopharmaceutical industry to rationally engineer and optimize CHO cell lines for drug development.

REVERSE ENGINEERING THE BRAIN: FROM NEUROSCIENCE TO ENGINEERING AND BACK AGAIN

Gabriel Silva
Professor of Bioengineering

The brain epitomizes a complex dynamical system, where the emergent properties that result from the interactions of the 'stuff' that makes it up, e.g., molecules, neurons, glia, and networks, far surpass the properties of the individual components. From an engineering and design perspective, the question is how is this achieved? How do these components interact together as a dynamical system and what are the rules (algorithms) implemented in the biological substrate that achieve this? The answer to this has neurobiological and clinical implications because it would allow us to understand how the brain works in health and how it fails in disease, as well as what might be done to fix it. But it also has possible non-biological applications to engineered neuromimetic systems that attempt to reproduce the computational power and robustness of the biological brain. For example in areas such as robotics, data analytics, and novel neural computing architectures. This talk will discuss some of our own work past and present towards these goals as well as some recent work from others. And we will speculate on what might drive the field moving forward.

ABOUT THIS RESEARCH:

Professor Silva and colleagues are working to capture the core functionality and properties of neurobiological processes responsible for the processing of information in the brain. This includes computational robustness and fault tolerance, ultra-low-power high performance computing, high efficiency distributed decentralized computation and adaptive computing. One goal is to apply these insights to engineered systems such as machine learning, robotics, big data analytics, and new computing architectures. The researchers' efforts involve integrating experimental neurobiology with mathematical modeling, computation, and engineering, in order to iteratively inform algorithm development.

CENTER FOR MICROBIOME INNOVATION

3:30 PM

THE CHEMICAL ROLE OF 4 POUNDS OF BACTERIA THAT LIVE IN AND ON EACH OF US

Pieter Dorrestein, Professor of Pharmacology, Chemistry and Biochemistry

Here we describe the generation, processing, and analysis of multi-omics data platforms from human, environmental, and animal samples as a part of the newly established Center for Microbiome Innovation and describe what opportunities there are to get involved with the center. With 16S rRNA amplicon, metagenomic and transcriptomic sequencing and mass spectrometry, we explore the relationship between chemistry and microbial communities. We will showcase how we can map such information with human skin and lungs in 3D. The first paper of the center that was submitted demonstrated that we can go from sample to data conclusions in less than 48 hours. While not yet routine, this achievement has far-reaching implications because it demonstrates that multi-omics methods can be applied in clinically relevant timeframes and approaches the speed of classical microbiology experiments.

ABOUT: CENTER FOR MICROBIOME INNOVATION

The UC San Diego Center for Microbiome Innovation leverages the university's strengths in clinical medicine, bioengineering, computer science, the biological and physical sciences, data sciences and more to coordinate and accelerate microbiome research. We also develop methods for manipulating microbiomes for the benefit of human and environmental health.

ADVANCED MATERIALS AND MANUFACTURING PROMOTING INTERDISCIPLINARY RESEARCH AND STUDENT MOBILITY

Olivia Graeve, Professor of Mechanical and
Aerospace Engineering

The CaliBaja Center for Resilient Materials & Systems supports and promotes research activities and technology development in the CaliBaja region, with emphasis in three strong technology sectors of the region: aerospace, biomedical devices, and manufacturing. The Center also connects the humanities, environmental sciences, and social sciences to promote bi-national student mobility and scientific collaborations. The Center brings together a multidisciplinary team of researchers and scholars that are highly responsive to: (1) the challenge of designing materials and systems for extreme environments such as those found in a variety of engineering applications (i.e., ultra-high temperatures, extreme pressures and deformations, radiation, acidic conditions, etc.); (2) the challenge of exploring the extreme social and economic contrasts found along the Tijuana-San Diego border, the busiest border in the world, a place where social extremes collide and converge to form a unique social fabric and an emerging bi-national identity. Both challenges require human capital highly versed in the newest technologies and a cultural understanding that can promote effective links between the two sides of the border.

ABOUT: CALIBAJA CENTER FOR RESILIENT MATERIALS & SYSTEMS

The Center is built around the concept of designing new materials and systems for extreme environments, as well as educating a technology-focused workforce for a thriving 21st century bi-national region. In the area of technology development, improvement and continued innovation of advanced technologies for aerospace, energy, nuclear, biomedical, and national security applications is critically dependent on the design and performance enhancement of new materials and devices. In particular, unique materials are required that can withstand extremes in stress, strain, temperature, pressure, chemical reactivity, photon or radiation flux, and electric or magnetic fields.
